Polynomials, Secret Sharing, Erasure Errors, General Errors, Self Reference

1 General Comments

1. Logistics

- Let students know that not everything will be covered during section.
- Also remind them to check the piazza for solutions and walkthroughs!

2. Erasure Errors

- This should go fairly quickly
- The first 4 questions (Before Exercises) are meant to be the lesson plan. Go over this together with the students
- First exercise problem is purely algebraic (Group 2 might want to skip)

3. Polynomials

- Draw a graph to visualize why $n+1$ points are needed for an n -degree polynomial.
- Make sure that the students are clear with the interpolation formula.
- Question 1a: Have students convince themselves that it works for the first few polynomials.
- Question 1b: Have students write out the first few polynomials to find a pattern with the degree.

4. Secret Sharing

- Explain how polynomials are used for secret sharing. basically what is the secret in terms of the polynomial? and what is shared among sharers?

- Figure out which of the schemes to use (polynomial facts, erasure code or general error?) It's most likely that we have not cover general error yet but it's fine to have a quick introduction/leave an open question.

2 Questions

2.1 Polynomials

1. Polynomial Facts

- Draw a picture to cover the rules in the box
- Good induction practice!!!

2.2 Erasure Errors

1. Send N

- Second one is more: set up equation as $(\text{how many packets are sent}) \times (\text{fraction packets not erased}) = (\text{number packets in original message})$
